Märkusi 1926. aasta kohta.

1926. a. viidi observatoorium endisist ruumest Tiigi tän. 15 Keskarihiivi majja Hetseli tän. 1. Uue asukoha koordinaadid on: $\varphi = 58^{\circ}22'45''$, $\lambda = 26^{\circ}42'54''$. Uued ruumid on vanast asukohast 299 m kaugusel, 121 m põhja ning 273 m lääne pool. Observatooriumi uue asukoha suhtes asub Peetri kiriku peatorni tipp põhjasihist $33^{\circ}30'$ ida pool.

Enne observatooriumi üleviimist uutesse ruumesse korraldati vanas kui ka uues asukohas tähtsamate meteoroloogiliste elementide paralleel-vaatlusi. Vaadeldavaiks elementideks olid: õhurõhumine, õhutemperatuur, tuul, sademed, auramine, absoluutne ja relatiivne niiskus.

Õhurõhumise paralleel-vaatluste andmed on 4 kuu kohta läbi töötatud (I. XII, 1925 — 30. III, 1926). Vanas asukohas mõõdeti õhurõhumist Schultze süsteemi kaussbaromeetri Nr. 2 abil, mille astmiku nullpunkt asus 74.45 m kõrgusel merepinnalt. Uues asukohas mõõdeti õhurõhumist Fuess'i süsteemi baromeetri Nr. 560 abil, mis asus merepinnalt 80.81 m kõrgusel. Vaatlusvaheaegsete ajamomentide jaoks iga 3 tunni tagant õhurõhumise väärtuste leidmiseks kasutati mõlemal juhul uues asukohas töötava Richard'i süsteemi elavhõbeda barograafi Nr. 11558 barogramme.

Tabel Nr. 1 sisaldab mõlema vaatluskoha dekaadide ja kuukeskmiste vahesid.

Tabel Nr. 1.

Õhurõhumise vahed.

Luftdruckdifferenzen.

Vahed vaatlusandmeis omavad suurimat väärtust talvekuil ning on tingitud peamiselt erinevast termomeetrite asetusest kummaski vaatluskohas*). Vanas asukohas mõõdeti õhutemperatuuri Assmann'i aspiratsioon-psühromeetriga, mis vastava sisseseadu abil aknast välja asetati 11 m kõrgusele maapinnalt (75 m merepinnalt), ning 3.75 m kaugusele maja seinast. Maksimum- ja miinimum-termomeetrid ning termograaf asusid maja katusel Wild'i onnis. Uues asukohas mõõdeti õhutemperatuuri aias Assmann'i psühromeetriga 2 m kõrgusel maapinnalt (68 m merepinnalt). Maksimum- ja miinimum-termomeetrid ning termograaf asusid seejuures inglise onnis samal kõrgusel maapinnalt.

Mõlemas vaatluskohas on **absoluutne ja relatiivne niiskus** määratud sulailmade puhul Assmann'i psühromeetri andmeil. Külma puhul määrati relatiivne niiskus juus-hülgromeetri abil, ning selle põhjal siis ka absoluutne. Juus-hülgromeetri õiendus leiti andmete võrdlemisel sulailmade puhul. Hülgrograafid, mille üleskirjutisi kasutati relatiivse niiskuse väärtuste interpoolimisel, asusid vanas vaatluskohas katusel Wildi onnis, ning uues — aias inglise onnis. Vaatluseandmete võrdlemisel saadud vahed olid kaduv-väiksed.

Tuule vaatlusi toimetati paralleelselt 4 kuu kestel (1. XII. 1925 — 30. III. 1926). Vanas vaatluskohas töötas Oettingen-Schultze süsteemi anemograaf Nr. 4, mis asus vaatlustorni platvormilt 3 m ning maapinnalt 20 m kõrgusel (82 m merepinnalt). Uues vaatluskohas mõõdeti tuult sama süsteemi anemograaf Nr. 5 ning Kuznetsov-Masingi süsteemi anemograafi abil, mis asusid observatooriumi uues vaatlustornis 29 m kõrgusel maapinnalt (96 m merepinnalt).

Tabelis Nr. 4 esinevad vahed ja suhted on saadud vanas vaatluskohas mõõdetud tuulekiiruste võrdlemisel uues asukohas Kuznetsov-Masingi süsteemi anemograafi abil mõõdetud kiirustega.

Päikesepaistet registreeris Velitško heliograaf, mis asus observatooriumi uue vaatlustorni platvormil.

Lumikatte paksust mõõdeti aias asuva mõõdupuuga.

Emajõe veepinna kõrgust loeti mõõdupuult, mille nullpunkt asus 29.51 m kõrgusel merepinnalt.

Lisaks eelmisel aastail toimetatud vaatlusile on observatooriumi uues asukohas juurde tulnud järgmised vaatlused:

Maapinna temperatuuri mõõtmine kogu aasta kestel 3 korda päevas 0.5 m, 1.0 m, 2.0 m, 3.0 m ja 4.8 m sügavuses ning maksimaalse ja minimaalse temperatuuri mõõtmine maapinnal. Soojemal aastaaegadel, mil maapind pole külmunud, toimub maapinna temperatuuri mõõtmine 3 korda päevas ka 0 sm, 5 sm, 10 sm ja 20 sm sügavuses. Peale selle töötasid 2 termograafi, mis registreerisid maapinna temperatuuri 0.25 m ja 0.50 m sügavuses. Maapinna temperatuuri kuukeskmised leiduvad kuu- ja aasta-ülevaateis.

1925. a. alates töötab observatooriumi uues asukohas aias hariliku sademetemõõtja kõrval veel iseregistreerija sademetemõõtja, mille andmed võimaldavad täpsamalt määrata sademete käiku aja suhtes.

Callendar'i aktinograaf seati mitmeaastase seismise järel uuesti korda ning töötama.

Uuesti juurde muretsedud tähtsamaist aparaatidest võiks mainida Angström'i pürheliomeetrit ja püranomeetrit, ning Savart'i polariskoopi. Nende aparaatide kui ka Finemann'i nefoskoobi vaatlusandmeid ei ole avaldatud käesolevas aastaraamatus.

Rahvusvahelisel kõrgemate õhukihtide uurimispäevil on tuulevaatlusi toimetatud piloot-pallide abil. Viimasel ajal on ka õhurõhu-

mist, temperatuuri ja niiskust mõõdetud kõrgemais õhukihtides meteorograafi abil, mis aeroplaani külge kinnitatult üles saadetakse.

Observatooriumi kaastööliste isiklikku koosseisu 1926. aastal kuulusid järgmised isikud: jaamade inspektor — G. Pimenow; van. assistendi k. t. — J. Sütt; vaatlejad — H. Liedemann, P. Hiiop (kuni 31. III.) ning A. Nurklik (alates 1. IV.); arvutusametnikud — H. Kurrik ja H. Raphoph; ajutised abijõud — A. Timpman, E. Maalman ja A. Ohu.

1925. a. maikuul lahkus haiguse tõttu Observatooriumi juhataja kohalt hra dots. K. Koch ning observatooriumi juhtimine usaldati allakirjutanu hooleks.

K. Frisch.

Meteor. Observ. juhataja.

Bemerkungen zum Jahrgang 1926.

Im Jahre 1926 wurde das Observatorium aus den Räumen in der Teichstrasse 15 in die Hetzelstrasse 1, das Haus des Reichsarchivs, übergeführt.

Die Koordinaten des neuen Observatoriums sind folgende: $\varphi = 58^{\circ} 22' 45''$, $\lambda = 26^{\circ} 42' 54''$. Der neue Beobachtungsort ist um 299 Meter vom alten entfernt, um 121 m in nördlicher und um 273 m in westlicher Richtung. In Bezug auf die neue Lage des Observatoriums liegt die Spitze des Hauptturmes der Petrikirche $33^{\circ} 30'$ von N nach E.

Vor der endgültigen Überführung des Observatoriums wurden im alten und neuen Observatorium parallele Beobachtungen der wichtigsten meteorologischen Elemente, wie Luftdruck, Lufttemperatur, Wind, Niederschläge, Verdunstung, Dampfdruck und relative Feuchtigkeit, angestellt.

Die Parallelbeobachtungen des **Luftdruckes** sind für 4 Monate (1. XII. 1925 — 30. III. 1926) bearbeitet worden. Im alten Observatorium wurde der Luftdruck am Gefässbarometer Schultze Nr. 2, dessen Nullpunkt 74.45 m über dem Meeresniveau lag, abgelesen. Im neuen Observatorium sind die Beobachtungen am Barometer Fuess Nr. 560, dessen Höhe über dem Meresspiegel 80.81 m beträgt, gemacht worden. Die Interpolationen des Luftdrucks für die zwischen den direkten Beobachtungen liegenden Termine erfolgten in beiden Fällen nach den Registrierungen des Quecksilberbarographen Richard Nr. 11558, der sich in den Räumen des neuen Observatoriums befand.

Tabelle Nr. 1 (S. 87) enthält die Differenzen der Dekade- und Monatsmittel für 8 tägliche Termine der beiden Beobachtungsorte.

Vergleiche der aus dem Beobachtungsmaterial abgeleiteten Differenzen mit denen nach der bekannten Höhenformel theoretisch berechneten weisen ganz geringe Unterschiede auf, was aus der Tabelle Nr. 2 (S. 88) zu ersehen ist.

Parallelmessungen der **Lufttemperatur** sind vom 1. VIII. 1925 bis zum 30. III. 1926 angestellt worden. Die Differenzen der Beobachtungsergebnisse des alten und neuen Observatoriums finden wir in

der Tabelle Nr. 3 (S. 88). *Die Werte in dieser, wie auch in den weiter folgenden Tabellen müssen den Angaben des alten Observatoriums hinzugefügt werden, um die des neuen zu erhalten.*

Die Differenzen, die im Winter ihr Maximum erreichen, sind durch die verschiedene Aufstellung der Thermometer an beiden Beobachtungsorten bedingt*). Es sei hier erwähnt, dass im alten Observatorium die Lufttemperaturbeobachtungen mit Hilfe eines Assman'schen Aspirationspsychrometers erfolgten, das in der Höhe von 11 m über dem Erdboden und 75 m über dem Meeresniveau längs einer Schiene auf eine Entfernung von 3.75 m vom Gebäude hinausgeschoben wurde; das Maximal- und Minimalthermometer, wie auch der Thermograph befanden sich in einer Wild'schen Hütte, die auf dem Dache des Gebäudes aufgestellt war. Im neuen Observatorium ist die Temperatur nach dem Assman'schen Psychrometer im Garten des Observatoriums in der Höhe von 2 m über dem Erdboden und 68 m über dem Meeresniveau beobachtet worden. Die Maximal- und Minimalthermometer, wie auch der Thermograph befanden sich daselbst in einer englischen Hütte von derselben Höhe.

In beiden Observatorien sind die Terminwerte des **Dampfdruckes** und der **relativen Feuchtigkeit** bei Temperaturen über dem Gefrierpunkt aus den gleichzeitigen Ablesungen des trockenen und feuchten Thermometers des Assman'schen Psychrometers berechnet worden. Bei Frost wurde die relative Feuchtigkeit an Haarhygrometern abgelesen, deren Korrekturen aus vielen Vergleichen bei Temperaturen über dem Gefrierpunkt bestimmt worden waren. Nach den Werten der relativen Feuchtigkeit wurde dann der Dampfdruck bestimmt. Die Vergleiche ergaben verschwindend geringe Differenzen.

Die Hygrographen, die bei den Interpolationen der relativen Feuchtigkeit zur Hilfe genommen wurden, befanden sich: im alten Observatorium in der Wild'schen Hütte auf dem Dach, im neuen — in der englischen Hütte im Garten.

Die **Windbeobachtungen** wurden im Laufe von 4 Monaten (1. XII. 1925—30. III. 1926) in beiden Observatorien gleichzeitig angestellt. Im alten Observatorium arbeitete der Anemograph Oettingen-Schultze Nr. 4, der sich 3 m über der Plattform des Turmes, 20 m über dem Erdboden und 82 über dem Meeresspiegel erhob. Im neuen Observatorium wurde der Wind vom Anemographen Oettingen-Schultze Nr. 5 und einem neuen, Kusnetzow-Masing'schen Anemographen registriert. Beide Apparate befinden sich auf dem Turme des Observatoriums in der Höhe von 29 m über dem Erdboden und 96 m über d. Meeresspiegel.

Die Vergleiche der Geschwindigkeiten nach dem Anemographen Oettingen-Schultze Nr. 4 des alten Observatoriums und dem Kusnetzow-Masing'schen des neuen Observatoriums ergaben die in Tabelle Nr. 4 (S. 89) befindlichen Resultate.

*) Vom April bis zum Juli liegt der wahrscheinliche Wert der Differenz unter 0.05°.

Die **Niederschläge** wurden im alten Observatorium mittels eines Regenmessers gemessen, der auf dem Dache des Gebäudes in der Höhe von 11.3 m über dem Erdboden aufgestellt war. Im neuen Observatorium befand sich der Regenmesser im Garten in der Höhe von 2 m über dem Erdboden. Parallelbeobachtungen sind vom 1. VIII. 1925 bis zum 30. III. 1926 gemacht worden und ergaben Differenzen laut Tabelle Nr. 5 (S. 90).

Die gleichzeitig angestellten **Verdunstungsbeobachtungen** erstrecken sich auf denselben Zeitraum vom 1. VIII. 1925 bis zum 30. III. 1926. Die Verdunstung wurde in beiden Fällen an einem Evaporometer Wild abgelesen. Im alten Observatorium war dasselbe in der Hütte auf dem Dach und im neuen Observatorium in einer englischen Hütte im Garten aufgestellt. Die Vergleiche ergaben die in Tabelle Nr. 6 (S. 90) befindlichen Differenzen.

Die **Sonnencheindauer** wurde im neuen Observatorium durch den Heliographen Welitschko, der auf der Plattform des Turmes aufgestellt worden war, registriert.

Die **Schneehöhe** wurde an einem Pegel im Garten des Observatoriums abgelesen.

Die Ablesungen des **Embachstandes** wurden an einem Pegel, dessen Höhe 29.51 m über dem Meeresspiegel beträgt., gemacht.

Ausser den schon früher angestellten Beobachtungen sind im neuen Observatorium noch nachstehende hinzugekommen:

Die Beobachtungen der Bodentemperatur in den Tiefen von 0,5 m, 1.0 m, 2.0 m, 3.0 m und 4.8 m, wie auch der maximalen und minimalen Temperaturen an der Erdoberfläche, die während des ganzen Jahres 3 mal täglich angestellt wurden, und die Temperaturen an der Erdoberfläche und in der Tiefe von 5 cm, 10 cm und 20 cm, die 3 mal täglich in den wärmeren Monaten gemacht wurden. Die Monatsmittel der Bodentemperaturen finden wir in der Monats- und Jahresübersicht. Ausserdem waren in Tätigkeit Thermographen, die die Bodentemperatur in der Tiefe von 0.25 m und 0.50 m registrierten.

Seit dem Jahre 1925 arbeitet im neuen Observatorium ein selbst-registrierender Regenmesser der neben dem gewöhnlichen Regenmesser in der Höhe von 2 m sich befindet. Den Registrierungen dieses Apparates wurden genauere Zeitangaben der Niederschläge entnommen.

Von Neuem in Stand gesetzt wurde nach vieljähriger Unterbrechung der Aktinometer von Callendar.

Neben diesen Apparaten verfügt das Observatorium über ein Angström'sches Pyrheliometer und Pyranometer so wie über ein Savart'sches Polariskop. Die Beobachtungen mit den genannten Instrumenten sowie diejenigen mit Hilfe des Fineman'schen Nephokops sind in vorliegender Ausgabe nicht veröffentlicht.

An den internationalen Termintagen sind regelmässig Windbeobachtungen der höheren Luftschichten durch Pilotballons angestellt

worden und in letzter Zeit auch Beobachtungen der anderen meteorologischen Elemente mit Hilfe von Meteorographen, die an Aeroplanen befestigt waren.

Der Personalbestand des Observatoriums war im Jahre 1926 folgender: Inspektor — G. Pimenow; stellvertretender älterer Assistent — J. Sütt; Beobachter — H. Liedemann, P. Hiiop (his 31. III.), A. Nurklik (vom 1. IV.); Rechnerinnen — H. Kurrik und H. Raphoph; zeitweilige Hilfskräfte — A. Timpman, E. Maalman und A. Ohu.

Im Mai 1925 musste der bisherige Leiter des Observatoriums Herr Dozent K. Koch krankheitshalber seinen Posten verlassen, und wurde die Leitung des Observatoriums dem Unterzeichneten übertragen.

K Frisch.

Direktor des Observatoriums.

Märkused II. järgu jaamade kohta 1926 a.

Kõigis vaatluskohtades tehti vaatlusi ühetüübiliste vaatlusriistadega ühise kava järele. Õhurõhumist mõõdeti kaussbaromeetritega, kuna õhurõhumise alalist käiku Richard'i barograafid registreerisid. Psühromeetrid, äärmustermomeetrid, juushügromeetrid ja termograafid olid ülesseatud inglisonnides. Tuule sihi ja kiiruse mõõtmiseks tarvitati Wild'i süsteemi tuulelippe. Sademeid mõõdeti vene-tüübiliste sademete-mõõtjatega, mis varustatud tuulekaitsega. Peale nende instrumentide olid jaamades päikesepaiste isemärkijatena tarvitusel Velitško süsteemi heliograafid. Mõnes jaamas mõõdeti maatemperatuure mitmesugustes sügavustes, miissugused andmed aga käesolevas teoses ei ole avaldatud. Samuti on avaldamata jäetud fenoloogiliste vaatluste andmed.

Kõigis jaamades toimetati vaatlusi kohalise aja järele kell 7,13 ja 21. Sademete hulk iga päeva kohta on antud millimeetrites hom. k. 7-st kuni järgneva päeva kella 7-ni. Märkustes leiduvad tähed n, a, p tähendavad aega üksikute vaatluste vahel:

- n — eelmise päeva kella 21-st kuni k. 7 hom.
- a — kella 7-est kuni k. 13
- p — kella 13-st kuni k. 21.

Kõigis vaatluste andmetes on arvestatud vastavate instrumentaal-õiendustega, baromeetrite andmetes peale selle veel temperatuuri ja raskuse õiendusega.

Vaatlused on avaldatud 15 jaamast, millede konstant-arvud on tabelis lhk. 117.

Peale nimetatud 15 jaama töötasid aruande aastal veel 5 jaama, mille vaatlused avaldamata jäävad, sest neid toimetati osalt mitte kogu aasta, osalt on nad puudulikud.

Vaatluste läbitöötamist toimetasid Observatooriumi ametnikud prl. H. Kurrik ja prl. H. Raphoph. Jaamade revideerimist koha peal, vaatlusriistade võrdlust ja vaatluste kontrolli toimetas allakirjutanu.

G. Pimenow.

Bemerkungen zu den Beobachtungen an den Stationen II. Ordnung im Jahre 1926.

An allen Stationen wurden die Beobachtungen einheitlich an denselben Beobachtungsapparaten angestellt. Der Luftdruck wurde an Gefäß-Barometern abgelesen und durch Richard'sche Barographen registriert. Die Psychrometer und Extremthermometer waren in englischen Hütten aufgestellt, wo auch die Haarhygrometer und Richard'sche Thermographen sich befanden. Die Windmessungen erfolgten an Wild'schen Windfahnen, die der Niederschläge an Regenmessern russischen Modells mit Schutzkegeln. Ausserdem wurde noch an den Stationen die Sonnenscheindauer mittels Welitschko'scher Heliographen registriert. An einigen Stationen wurde noch die Temperatur des Erdbodens in verschiedenen Tiefen abgelesen, doch sind diese Daten wie auch die phänologischen Beobachtungen in vorliegender Ausgabe nicht veröffentlicht.

Die Beobachtungen erfolgten nach der Lokalzeit um 7^h, 13^h und 21^h. Als Niederschlagsmenge eines gegebenen Tages gelten die von 7^h morgens bis 7^h morgens des nächsten Tages gefallenen Niederschläge. Die in den Anmerkungen vorkommenden Buchstaben n, a, p bedeuten die Zeit zwischen den Beobachtungsterminen:

- n — vom vorhergehenden Tage 21^h — 7^h morgens
- a — die Zeit von 7^h — 13^h
- p — die Zeit von 13^h — 21^h.

An allen Beobachtungen wurden Instrumentalkorrekturen angebracht, an die des Luftdruckes noch die Temperatur- und Schwerekorrektur.

Veröffentlicht sind die Beobachtungen von 15 Stationen, deren Konstanten in der Tabelle auf Seite 117 enthalten sind.

Ausser den erwähnten 15 Stationen waren im Berichtsjahr noch weitere 5 Stationen in Tätigkeit, deren Beobachtungen sich aber nicht über das ganze Jahr erstreckten und teilweise noch lückenhaft waren, so dass von einer Veröffentlichung dieser Daten Abstand genommen werden musste.

Alle Beobachtungen wurden von den Beamtinnen des Observatoriums Frl. H. Kurrik und Frl. H. Raphoph bearbeitet. Die Revision der Stationen sowie die Kontrolle der Beobachtungsapparate und der Beobachtungen erfolgten durch den Unterzeichneten.

G. Pimenow.

Märkused sademete, kõue- ja lumikatte-vaatluste kohta.

Alamjärgulistes ilmajaamades ja vaatluskohtades toimetati sademete, kõue ja lumikatte vaatlusi. Peale selle tähendati üksikutes vaatluskohtades üles veel sisevete kinnikülmumist ja lahtiminekut.

1926 a. töötasid Eestis kokku 59 sademejaama, mille vaatlustele veel 17 II-järgu meteoroloogia jaama andmed lisaks võeti.

Sademete rohkust mõõdeti igal hommikul kell 8 venetüübiliste sadememõõtjatega, mis varustatud tuulekaitsega. Kõik sadememõõtjad asetustid 2 meetri kõrgusel maapinnast. Vaatlustabelites on antud sademete kuu- ja aastasummad, kõige suurem ööpäevane hulk ja päevade arv sademetega üksikute vaatluskohtade järele. Lumepäevadeks on arvatud need päevad, millal üldse lund on sadanud, ning sademete koguhulk kell 8 hom. kuni järgmise päeva kella 8 hom. oli vähemalt 0.1 mm.

Kõue- ja rahevaatlusi toimetati kokku 126 vaatluskohas. Vaatlustabelites on antud kõue algus ja kõuepäevade üldarv, kus juures märk ☐ tähendab lähedat kõuet, T — kauget müristamist, ✎ aga pätku.

Rahe vaatlustabelites on samuti antud rahesaju algus ning rahepäevade arv üksikute vaatluskohtade järele. Tähtpäevad rahekahjudega on jämedalt trükitud.

Tabelites leiduv märk (.) tähendab, et vaatlusi ei ole tehtud, märk (—) aga, et vastavat nähtust ei ole olnud.

Andmed lumikatte kõrguse kohta 1926/1927 talvel on kokku 90 vaatluskohast. Lumikatte kõrgust mõõdeti nagu eelmistel talvedelgi kell 8 hommikul. Vaatlusteks tarvitati sentimeetritesse jagatud mõõdupuud, mis enam-vähem tuulest kaitstud ja tasasele kohale oli üles seatud. Tabelites on antud dekaadide keskmine lumekõrgus sentimeetrites. Nimetatud andmed saadi kümne päeva lumekõrguse summa jagamisest päevade arvu peale. Tabelites tähendab 0, et dekaadi keskmine lumekõrgus oli alla 0,5 sentimeetri, kriips (—) et dekaadi jooksul üldse lumikatet ei olnud, punkt (.) aga, et vaatlusi ei ole tehtud.

Nii kõue, rahe kui ka lumikatte vaatluste jaoks on antud ühine vaatluskohtade nimestik, kus juures ☐ tähendab, et vastavas kohas ainult kõue ja rahe vaatlusi toimetati, märk ▲, et ainult rahevaatlusi tehti, märk ✕ aga, et ainult lumikatte kõrgust mõõdeti.

Kõigis tabelites on vaatluskohad korraldatud geograafilise pikkuse järele läänest idasse.

Lõpuks on antud sisevete kinnikülmumise ja lahtimineku tähtpäevad. Kinnikülmumise päevaks loeti seda päeva, millal vaadeldav veeala kas või õhukese jääkorraga oli kaetud, või kunas liikuv jää seisma jäi ja ühte külmas. Vete lahtimineku päevaks arvati seda päeva, millal jääkate katkes või liikuma hakkas.

Vaatluste läbitöötamist toimetasid observatooriumi ametnikud prl. H. Kurrik ja prl. H. Raphoph, vaatluste kontrolli toimetas allakirjutanu.

G. Pimenow.

Bemerkungen zu den Niederschlags-, Gewitter- und Schneebeobachtungen.

An den Stationen niederer Ordnung wurden die Niederschläge, die Gewitter, die Hagelfälle sowie die Höhe der Schneedecke beobachtet. An einzelnen Beobachtungspunkten wurde ausserdem der Zu- und Abgang der Binnengewässer notiert.

Im Berichtsjahr waren 59 Regenstationen in Tätigkeit, zu denen die Beobachtungen an 17 Stationen II. Ordnung hinzukommen.

Die Niederschlagsmengen wurden täglich um 8 Uhr morgens an Regenmessern russischen Modells mit Schutzkegeln gemessen. Letztere waren alle in gleicher Höhe aufgestellt, so dass der obere Rand sich 2 Meter über der Erdoberfläche befand. In den Beobachtungstabellen finden sich die Monats- und Jahressummen, die grösste Tagesmenge und die Zahl der Tage mit Niederschlägen für die einzelnen Stationen.

Als Tage mit Schnee gelten solche, an denen es geschneit hatte und die gemessene Niederschlagsmenge von 8 Uhr morgens bis zum nächsten Morgen 8 Uhr wenigstens 0.1 mm betrug.

Gewitter- und Hagelbeobachtungen sind an 126 Beobachtungspunkten angestellt worden. In den Tabellen sind angegeben die Zeit des Beginns der Erscheinung sowie die Anzahl der Gewitter- bzw. Hageltage an den einzelnen Beobachtungspunkten. Die Zeichen, ⚡, T und ⚡ bedeuten Gewitter, Donner und Wetterleuchten. Die Tage mit Hagelschäden sind fett gedruckt.

In den Tabellen bedeutet ein Punkt (.), dass im entsprechenden Monat keine Beobachtungen angestellt worden sind, während ein Strich (—) anzeigt, dass keine entsprechende Erscheinung zur Beobachtung kam.

Messungen der Schneehöhe im Winter 1926/1927 sind von 90 Stationen eingelaufen. Sie erfolgten täglich um 8 Uhr morgens an in Centimeter eingeteilten Masstäben, die an ebe-

nen und vor Wind geschützten Stellen aufgestellt waren. In den Tabellen befindet sich die mittlere Schneehöhe für die Dekaden in Centimetern, die durch Teilung der Summen der täglich gemessenen Schneehöhe für die Dekade durch die Anzahl der Tage der Dekade gefunden wurde. In den Fällen, wo der Mittelwert 0.5 cm nicht erreichte, steht in der Tabelle eine 0. Ein Strich (—) bedeutet das Fehlen der Schneedecke, ein Punkt (.) das Fehlen der Beobachtung.

Die Gewitter- und Schneebeobachtungen haben ein gemeinsames Stationsverzeichnis. Die Zeichen ☩, ▲ und ✖ vor den Beobachtungspunkten geben an, dass an den betreffenden Stationen nur Gewitter, Hagel bzw. die Schneedecke beobachtet wurde.

In allen Tabellen sind die Stationen der geographischen Länge nach von Westen nach Osten geordnet.

Zum Schluss sind Beobachtungen über den Auf- und Zugang der Binnengewässer nach deren Abflussgebieten gegeben. Als Tag des Zugangs gilt derjenige, an dem die Oberfläche des Gewässers mit einer wenn auch nur leichten Eisdecke bedeckt, oder das Treibeis gefroren und zum Stillstand gekommen war, als Tag des Aufgangs derjenige, an dem das Eis am Beobachtungsort aufgegangen oder in Bewegung geraten war.

Bearbeitet wurden die Beobachtungen von den Beamtinnen des Observatoriums Frä. H. Kurrik und Frä. H. Raphoph, die Kontrolle erfolgte durch den Unterzeichneten.

G. Pimenow.
